

Product Information

LabMaster - module

Multiple work place system

The module broadens the range of functions of LabMaster to a multiple work place system. Up to 5 work places can access a database saved on the network.

With this function, test and evaluation can be carried out on different work places or multiple testing machines can save test results to the same database simultaneously.

Changes to data and settings (templates, log layout, evaluation algorithms) are immediately available to every work place.

Opposite to the version for single work places, simultaneous access to system settings, global settings and measuring series etc. is disabled.

Data administration is done by the computer that provides the database-server-function.

For an exact definition of the required network topology and administration, consultation between the computing departments is necessary.
